                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 1521.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnoshing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell dependencial, appecifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymcleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3,
                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Example 8; SEQ ID NO 5262; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome fQ21.3. Z2.2., MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 15q26.1. Zand MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3. MDZ4, MDZ1, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is concoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p11.3 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p12.2 and MDZ12 is encoded at chromosome 16p12.2 and MDZ12 is encoded at chromosome 16p12.2 and MDZ12, encoded at chromosome 2cc associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, encoded at expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic 2cc acids and also be used as probes to detect and characterize gross acids can also be used as probes to detect and characterize gross atterations in MDZ3, MDZ4, MDZ7, or MDZ12. The mucleic 2cc alterations in MDZ3, MDZ7, or MDZ12 geneficial can also be used as probes for measuring gene expression. The 2cc useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as 2cc vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 8% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying uduntifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour cupression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of tumours and an animals.
                                                                                                                                                                                                                                                                                                                                                                                     cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss;

Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  useful for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                     Tumour suppression/reversion associated nucleotide #5552.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0.4%; Score 15; DB 1; Length 17;

The present invention describes a new isolated nucleic acid sequence (I) comprising a DPP10 mRNA sequence. DPP10 is a dipeptidyl peptidase (also known as prolyholigopeptidase). (I) has antinifammacrory, antiasthmatic, antiasthmatic, antiarchmatic, antiarchmatic antirhreumatic activities, and can be used in vaccines and gene therapy. A composition comprising (I) can be used in vaccines and gene therapy. A composition comprising (I) can be cor for preventing or treating inflammatory disease e.g., inflammatory or for preventing or treating inflammatory disease e.g., inflammatory cor bowel disease, asthma, atopy, rheumatoid arthritis or psoriasis. (I) can be used in an assay for detecting or measuring DPP10 in a sample. A chost cell comprising (I) can be used for producing recombinant DPP10 gene cor treatment of individuals having or susceptible to inflammatory disease. Human DPP10 is located on chromosome 2, more specifically chromosome 214. ABQ84254 to ABQ84254 to ABQ8425559 to ABPS5569 represent cor sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                      New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cell-cycle dependent kinase cdk4 ribozyme binding site SEQ ID NO:481.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                present invention relates to a hairpin or hammerhead ribozyme,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0.4%; Score 15; DB 1; Length 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAH58057
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a new isolated nucleic acid sequence (I) comprising a DPP10 mRNA sequence. DPP10 is a dipeptidyl peptidase (also known as prolyfoligopetidase). (I) has antinifanmacory, antiasthmatic, antiasthmatic, antiathmatic, antiarthmatic and antinheumatic activities, and can be used in vaccines and gene therapy. A composition comprising (I) can be used for the manufacture of a medicament for requiating DPP10 expression or for preventing or treating inflammatory disease e.g., inflammatory bowel disease, asthma, atopy, rheumatoid arthritis or psoriasis. (I) can close used in an assay for detecting or measuring DPP10 in a sample. A host cell comprising (I) can be used for producing recombinant DPP10 gene products, or in drug screening systems to identify agents for diagnosis or treatment of individuals having or susceptible to inflammatory disease. Human DPP10 is located on chromosome 2, more specifically chromosome 2g14. ABQ84254 to ABQ84612 and ABP55569 to ABP55629 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.

                                                                                                                                                                            The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (1). (1) can have antipoeriatic, ophthalmological, vulnerary, keratolytic and virucide activities, and in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, aquamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, virreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing carring such as keloid, adhesion and hypertrophic or hypertrophic burn exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                   Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Analysis of cDNA and gene expression - by amplification of mRNA followed

This primer oligonucleotide, termed T75F2, was used with primer T75R3 rese AAX25324) in chromosomal mapping studies of the human TRL (TWF receptor-like) gene. They are based on a unique sequence of the human 3'UTR. The gene was mapped to chromosome 6p25. The invention provides full-length human and murine TRL proteins (see AAY05695-97), TRL fusion proteins, antigenic peptides and anti-TRL antibodies, as well as TRL nucleic acids (see AAX25320-23), recombinant expression vectors, host of all and non-human transgenic animals. TRLs are regulators or modulators of cellular signal transduction, cellular proliferation or differentiation, cell survival and apoptosis, immune system cells, and cells involved in insulin resistance or the diabetic response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TRL; TNF receptor-like; tumour necrosis factor receptor; human; signal transduction; cell differentiation; prostate cancer; inflammation; arthritis; diabetes; insulin resistance; diagnosis; therapy; PCR; primer;
                                                                                                                             A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid encoding tumor necrosis factor receptor-like protein.

The present sequence is an oligomuclectide used for antisense modulation of interleukin-5 (IL-5) signal transduction. Oligomucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligomucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligomucleotides are also useful for research uses and to prevent or delay infection, inflammation or tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense oligonucleotide compound used to treat asthma and eosinophilic syndrome in humans modulates interleukin-5 signal transduction.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present DNA sequence is the nested gene-specific primer DHRD.91.84, used for amplification of human neuronal-specific 7 transmembrane cDNA, pbructo. The major site of pNEUGO expression is the sensory neuroretina. Mutations of this gene is associated with the etiology of age-related macular degeneration (AMD). This sequence has ophthalmological activity. The pNEUGO polypeptides and polymucleotides are used for screening, diagnosis and therapy of macular degeneration. The DNA sequences are useful for detection of pNEUGO mutation carriers, prenatal pNEUGO screening and diagnosis of AMD, and in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                The present PCR primer was used to amplify mutations of the human Barx2 gene. Barx2 is a ras-responsive transcription factor. The Barx2 gene is mutated in ovarian cancer, and the 5' end of the Barx2 transcript is not expressed in several ovarian cancer cell lines. It is believed that the Barx2 gene is involved in ovarian cancer as a tumour suppressor gene. The specification describes a method for diagnosing cancer (or susceptibility to it) in a patient. The method comprises contacting a nucleic acid sample with an oligonucleotide which selectively hybridises to the Barx2 gene (or mutant allele) or Barx2 cDNA. The methods are useful for diagnosing, determining susceptibility to, and treating cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Recognition system, e.g. for identifying nucleic acids, comprises at least one recognition unit comprising a region with a defined structure adjacent to a region with a randomized structure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Recognition system; screening; identification; pharmaceutical; toxin; plant protection agent; toxin; venom; carcinogen; venom; teratogen; herbicide; fungicide; pesticide; beta-actin; human; ss.

This invention describes a novel recognition system comprising at least I recognition unit bound to a support, each recognition unit comprising a recognition with a defined structure adjacent to a region B with a randomized structure. The recognition system is useful for screening, identifying, or characterizing at least 1 component of a sample, especially nucleic acids and/or proteins, and for screening for and/or identifying cellular or synthetic binding partners, preferably proteins, peptides, nucleic acids, chemical agents, preferably organic compounds, pharmaceuticals, plant protection agents, toxins, venoms, carcinogens, teratogens, herbicides, fungicides or pesticides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cycostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 4543; 872pp; English.

first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or The invention relates to a novel pharmaceutical composition, which has a

Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal transduction

Example 23; Page 22; 77pp; English.

The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (IL)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian in calls or tissues, for altering the ratio of the isoforms of mammalian lib-5 receptor a in mammalian calls or tissues, treating a mammalian having a disease or condition associated with IL-5 signal transduction,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                 A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ Files AAQ75547-CD5798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a method of selecting genetic markers as targets for nucleic acid sequence amplification comprising selecting each of the genetic markers according to a heteroxygosity index of 0.5 or greater. Selecting and amplification of genetic markers are useful as targets for nucleic acid sequence amplification, for genetic testing or facilitating multiplex PCR amplification from limiting amounts of target nucleic acid. The methods are also useful for improving genetic diagnostic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Selecting genetic markers as targets for nucleic acid sequence amplification, useful for improving genetic testing, e.g. fetal sex determination, comprises selecting each of the genetic markers according

determing methods, such as prenatal diagnostic testing, foetal sex determination or genetic identification, e.g. DNA profiling or DNA fingerprinting. The nucleic acid sequence amplification is also useful forensic analysis of degraded, oncient and difficult samples that are difficult to amplify and identify. This sequence represents a PCR primer used in the selection and amplification of genetic markers

                                                                                                                                                                                                                                                                                                                                                                                                                                         The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is an HIV target duplex contg. a purine-rich region concentrated on one chain of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HIV, hepatitis, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. The oligomer contains an inverted polarity region formed from an o-xyloso dimer synthon. The sugars linked via the o-xylene from an o-xyloso dimer synthon. The sugars linked via the o-xylene ring). Two nucleotides, in this case Tr, are coupled through a xylene residue to form the dimer synthon. This additional modifications may rendering the oligomer stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also AAQ25452-25501 and AAQ3026-448. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

with RNA cleaving activity, which modulates the expression of a plant gene. Also described is a gene comprising a cDNA sequence encoding maize Delta-9 desaturase. (I) can be used to modulate expression of a gene, preferably Delta-9 desaturase or a granule bound starch synthase (GBSS) gene, in a plant (preferably a maize or canola plant). (I) can be used to modulate caffeine synthesis in a coffee plant, nicotine production in a tobacco plant, fruit ripening processes in an apple, tomato, pear, plum or peach plant, flower pigmentation in a rose, petunia, chrysanthemum or marigold plant or lignin production in a tobacco, aspen, poplar or pine
                                                                                                                                                                                                                                                               Skokut TA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an enzymatic nucleic acid molecule (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                               Ribozyme which modulates plant gene expression - preferably modulates expression of DELTA-9 desaturase or granule bound starch synthase in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Oligonucleotides AAV36181-210 are used for PCR amplification, sequencing, and detection in the course of the invention. The specification describes amethod for the diagnosis of Pneumocystis carinii which comprises detecting the presence of a mucleic acid sequence containing the 26S FRNA gene specific for P. carini in a sample. The 26S FRNA gene in a sample is amplified, and the primer extension products detected by hybridisation with a labelled oligonucleotide. The methods can be used for the diagnosis of P. carinii infection and for the detection of various
                                 Detection of Pneumocystis carinii - by amplification of nucleic acid from sample with PCR primers specific for the 26S rRNA gene of Pneumocystis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        amplification and sequencing of Pneumocystis carinii nucleic acid sequences. The primers are used in the in vitro method of the invention, which assays for an inhibitor of the catalytic Group I self-splicing intron reaction in the nuclear RRNA genes of P. carinii. The method is useful for screening potential drugs for treating P. carinii infections before more costly animal testing is conducted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Primer used for amplification and sequencing of P. carinii sequences.

the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a compounds with the tNA sequence. The method comprises generating a compounds with the tNA sequence. The method comprises generating a corording to defined criteria. Also described are: (1) a method of the tNA according to defined criteria. Also described are: (1) a method of the tNA sequence comprising criteria, and evaluating in silico the binding of the virtual compounds in silico defined criteria, and evaluating in silico the binding of the virtual compounds to defined criteria, and evaluating in silico the binding of the virtual compounds that modulate the expression of a tNA sequence via binding of the compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation of and identification of synthetic compounds having defined physical, chemical or bioactive properties. Information gathered from assays of such compounds is used to identify nucleic acid sequences that are continuated and is used to identify nucleic acid sequences that are continuated and is used to identify nucleic acid sequences that are continuated and discovery and target validation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a PCR primer used in the construction of a yeast artificial chromosome artificial chromosome of the invention. The yeast artificial chromosome (YAC) vectors contain a reporter gene and transgenic mammals produced using them may be used to screen for an agent affecting nucleotide expression and gives easter monitoring of in vivo expression. The vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               is used in the production of transgenic mammals for testing potential pharmaceutical or veterinary agents. pYAM4 is used to amplify YAC. The assay may be used to screen for agents useful in treatment of disturbance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             disorders related to the expression pattern of a nucleotide such as those above. The vectors have more concentrated YAC DNA, which allows better and more reliable gene transfer. The presence of a reporter gene allows easy monitoring of in vivo expression and the vectors allow for gene easy monitoring of 35 fold) and easy site determination. The pYAM amplification vector does not contain the thymidine kinase gene, which causes male infertility in transgenic mice
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of circadian function, sleep disorders, eating disorders, premenstrual syndrome, autoimmune disorders, birth defects in women and/or sexual dysfunction. The agents thus detected may be used for treatment of

The PCR product was used as a probe in Southern hybridization analysis. The invention relates to new B. cereus mutants that do not produce active HBL owing to the introduction of a mutation that inactivates a HBL component. The mutants are useful for biological control of plant pathogens. They have the same biocontrol activity as wild-type strains without the concerns for human pathogenicity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New mutant Bacillus useful as a biocontrol agent for biological control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  denoted hblA-R, was used with primer hblA-F (see AAZ20255)

Antisense compounds targeted to steroid receptor RNA activator useful for diagnosis, prophylaxis and treatment of diseases associated with the steroid activator, such as infection, inflammation or tumor formation.
                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is one of a large number of antisense oligonucleotides which is directed against one of four human steroid receptor RNA activator (SRA) nucleic acid sequences. Two series of antisense oligonucleotides were synthesised. The first series comprised 9.30 oligodeoxynucleotides with a phosphorothicate backbone. The second series comprised chimeric oligonucleotides composed of a central gap region, consisting of ten 2'-deoxynucleotides, which was flanked on both sides by four-nucleotide wings. The wings were composed of 2'-methoxyethyl (2'-MOE) nucleotides. Both series contained the same methoxyethyl (2'-MOE) nucleotides of prevent or delay infection, diagnosis, treatment and prophylaxis to prevent or delay infection, inflammation or tumour formation. Therapeutically the oligonucleotides are highly safe and are effectively administered to humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; Akt-3; protein kinase; cytostatic; antiinflammatory; infection; antisense therapy; inflammation; tumour; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAZ47685 to AAZ47768 represent phosphorothicate antisense oligonucleotides targeted to human CD40, which can be used to inhibit the expression of human CD40 is involved in lymphocyte activation, tumour growth and/or angiogenesis. Inhibition of CD40 is used to treat or prevent immune-associated diseases (specifically guest vs. host disease, allograft rejection or autoimmune diseases); inflammation (specifically asthma, rheumatoid arthritis, allograft rejection, inflammatory bowel disease or psoriasis) or hyperproliferation (specifically cancer and tumours). the antisense oligonucleotides are also useful as diagnostic and research reagents. AAZ47769 represents the human CD40 nucleotide sequence. AAZ47770 to AAZ47775 represent human CD40 forward and reverse PCR primers, and a human CD40 PCR probe, respectively. AAZ47773 to

30 nucleobases in length targeted to a nucleic acid encoding human Akt-3. The antisense compounds are useful for inhibiting the expression of human Akt-3 in human cells or tissues. They are also useful for modulating the expression of Akt-3, and for treating a human or an animal suspected of having, or being prone to, a disease or condition associated with Akt-3 expression. The antisense compounds may also be used as research reagents, in kites and in diagnostics, e.g. to elucidate the function of a particular gene or to distinguish between functions of various members of a biological pathway; and as a prophylactic, e.g. to prevent or delay infection, inflammation or tumour formation rreating a disease or condition associated with Akt-3 or in preventing or delaying inflammation or tumor formation. The present sequence was used to generate a polypeptide with extended polyglutamine regions. This was performed in an example illustrating a method for identifying a compound which disrupts polypeptide aggregation. The method is carried out using a cell which has been genetically modified to express aggregation-disposed polypeptides, or using purified aggregation-disposed polypeptides to express this proposed polypeptides.

The sequences given in AAC85227-50 are primers which were used to determine the size of the integrated YAC 35D8/D6 and YAC HSC7B526/V12 constructs in a transgenic founder animal. The constructs were prepared from novel yeast artificial chromosome (YAC) vectors each of which comprises a centromere, two telomeres, at least one origin of replication, an internal ribosomal entry site (IRES), and a selection gene that is specifically removable from the vector. The resulting YAC are used to produce transgenic organisms for use in screening for agents that can affect the expression pattern of a nucleoxide sequence of interest (NOI) or the activity of its expression product. The identified agents are potentially useful as pharmaceutical and veterinary agents for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Transgenic organism for identifying potential therapeutic agents able to modulate gene expression, comprises a yeast artificial chromosome vector.

treating disorders of circadian function; sleep or eating disorders; premenstrual syndrome; autoimmune diseases; birth defects in women and/or sexual dysfunction, and also as lead compounds for developing agents with other activities. YAC can also be used for expression, regulation and/or functional studies on NOI, in combination with other NOI, compounds or compositions. The new vectors provide high YAC copy numbers and allow easy monitoring (in vivo) of the expression pattern of NOI; (over)expression of NOI and a reporter gene; and determination of the sites where NOI is expressed. Incorporation of IRES allows expression of at least two nucleic acid sequences (e.g. NOI plus a reporter of more Sequence 18 BP; 8 A; 4 C; 4 G; 2 T; 0 U; 0 Other; Query Match Best Local Similarity than one NOI) Synthetic. Novel agent for inhibiting protein-protein interaction useful to treat Alzheimer's disease, has two domains which bind first, second proteins with seven consecutive glutamine residues and a domain separating two Housman DE; Thompson L, WPI; 2002-280948/32. Kazantsev A, domains The present invention relates to therapeutic agents comprising a first domain (D1) that binds a protein having at least seven consecutive glutamine (Glu) residues, a second domain (D2) that binds another protein having at least 7 consecutive Glu residues, and a third domain (D3) that separates D1 from D2. The therapeutic agents of the invention are useful for inhibiting protein-protein interactions (e.g. aggragation, dimerisation or other physiologically significant association), and can be used for treating Alzheimer's disease, and disorders in which

polyglutamine-containing transcription factors or coactivators are desirably active (e.g. disorders associated with homodimerisation of jun or hexamerisation of p53. The therapeutic agents can also be used to treat various disorders, including those associated with expanded trinucleotide (CAG) repeats. For example such disorders can include Huntington's disease (HD), primal and bulbar muscular atrophy (SBWA), dentatorubral-pallidoluysian arrophy, spinocerebellar ataxia type 1, type dentatorubral-pallidoluysian atrophy, spinocerebellar ataxia type 1, type 2, type 7 or Machado-Joseph disease (MJD/SCA3). The present sequence represents an oligonucleotide used to generate double stranded ô that resides on a phage display expression vector, produce and package the phage display expression vector in an infectious filamentous phage particle in the absence of a helper phage. Filamentous phage are characterised by having a single-stranded DNA genome that is encased by a long capsid cylinder. The invention preferably uses genes from filamentous phage (Ff phage) that infect Escherichia coli, including M13, filamentous phage (Ff phage) particularly for generating recombinant filamentous phage, particularly for generating recombinant filamentous phage without the use of a helper phage. The present sequence bacterial strain; packaging function; filamentous bacteriophage; phage display expression vector; infectious filamentous phage particle; helper phage; capsid cylinder; filamentous phage; Ff phage; M13; fl; fd; filamentous peptide; filamentous phage; PCR; primer; ss; New bacterial strain comprising one or more genes that encodes a packaging function of a filamentous bacteriophage, useful for displaying genes that encodes a packaging function of a filamentous bacteriophage where the one or more genes can, together with at least one other gene Gaps This invention relates to a novel bacterial strain comprising one ; 0 Score 14.8; DB 1; Length 18; Pred. The identified genes or fragments of these genes can be used for identifying genes and gene products that are intimately related to malignant transformation or maintenance of the malignant properties of cancer cells. It can also be used to design or screen diagnostic reagents or therapeutic compounds. Kits are included within the scope of the invention

AAV10720-V10747 are primers used in a method to identify the novel human breast cancer gene CH8-Za13-1 by differential display. The identified genes or fragments of these genes can be used for identifying genes and gene products that are intimately related to malignant transformation or maintenance of the malignant properties of cancer cells. It can also be used to design or screen dismostic reagents or therapeutic compounds. Kits are included within the scope of the invention
                                                                                                                                                                                                                                                               Gaps

AAV51371-V51390 are PCR primers used in the amplification of a novel human trabecular meshwork induced glucocorticoid response protein (TIGR) promoter region which is used in a method for diagnosing glaucoma in a patient. The method involves the detection of polymorphisms whose presence is predictive of a mutation affecting TIGR response in the patient and can be diagnostic of glaucoma or steroid sensitivity. Base substitutions and base additions upstream of and within TIGR exons can
                                                                                                                                                            of TIGR nucleic acid sequences - used for, e.g. developing products diagnosis, prognosis and treatment of glaucoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.

polymorphism (SSCP) screening of the human TIGR (trabecular meshwork inducible glucocorticoid receptor) gene. The primers correspond to sequences found within the TIGR promoter and two of the exons of TIGR, and are used in the method of the invention. The specification describes a method for the diagnosis and treatment of glaucoma, based on detecting specific polymorphisms in the promoter of the TIGR gene. The cetting specific polymorphisms in the promoter of the TIGR gene. The cetting specific polymorphisms in the promoter of all types), steroid sensitivity and progressive ocular hypertension that leads to steroid sensitivity and progressive ocular hypertension that leads to binds to cis-acting elements within the TIGR promoter. The TIGR promoter (or other regulatory regions) can be used to express homologous or heterologous genes, particularly for tissue-specific expression of therapeutic transgenes for treating glaucoma, also to generate transgenic alimals and in screening for compounds (specific modulators) with
                                                                                                                              ij
The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          diagnostic or therapeutic potential. Fragments of the TIGR sequence can

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (WMP), cyclin, cell-cycle dependent Kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a cucleic acid segment encoding (I). (I) can have antipsoriatic, dermatcological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and vincide activities, and cleaves RNA encoding Cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, cytokine basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy etinopathy of
                                                                                                                                                             ö

The present invention describes a collection of binding groups for a family of nucleic acids comprising members of relative high and relative the significance, where the binding groups are selected to be capable to identify, alone or in combination, essentially all members of the family of nucleic acids of relatively high significance. The collection of binding groups is useful for typing of nucleic acid in a clinical sample, by contacting the nucleic acid with the collection and determining whether one or more binding groups bound to the nucleic acid of the sample. This method is useful for determining whether the sample comprises at least a part of a member of relatively high significance of a family of nucleic acids. The collection of binding groups is useful for diagnosing the severity of a disease caused by a pathogen containing a member of a family of nucleic acids. ABL88779 to ABL89321 represent oligonucleotide sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Collection of binding groups for determining or typing samples, especially clinical samples, has groups capable to identify essentially all members of the family of nucleic acids of relatively high

```
Clock gene Baml2 and expressed clock protein BMAL2 important in clock oscillation mechanism and relating to circadian rhythm, used in diagnosis of and developing drugs for insomnia and other sleeping disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a DNA sequence encoding clock protein BMAL2 (brain-muscle-Arnt-like protein 2). The gene and protein are applicable in diagnosis of and development of drugs for insomia and other sleeping disorders e.g. non-24-hour sleep, sleep-phase forward or retreat syndrome and time-zone variation syndrome. ABS68501-ABS68552 represent BMAL2
                                                                                                                                                                         Human; clock protein BMAL2; brain-muscle-Arnt-like protein 2; insomnia; sleeping disorder; non-24-hour sleep; sleep-phase forward; primer; retreat syndrome; time-zone variation syndrome; PCR; ss.
                                                                                                                                  Clock gene Bmal2 (brain-muscle-Arnt-like protein 2)-related primer #21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score 14.8; DB 1; Length 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a collection of binding groups for a family of nucleic acids comprising members of relative high and relative low significance, where the binding groups are selected to be capable to identify, alone or in combination, essentially all members of the family of nucleic acids of relatively high significance. The collection of binding groups is useful for typing of nucleic acid in a clinical sample, by contracting the nucleic acid with the collection and determining whether one or more binding groups bound to the nucleic acid of the sample. This method is useful for determining whether the sample comprises at least a part of a member of relatively high significance of a family of nucleic acids. The collection of binding groups is useful for diagnosing the severity of a disease caused by a pathogen containing a member of a family of nucleic acids. ABL88779 to ABL89321 represent

Particular expressed sequence tags from human CDNA - corresponds to transcription prods. of genes, useful for tagging genes, mapping chromosomes and tissue typing.

Venter JC, Adams MD;

WPI; 1993-036325/04.

```
The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset confidence, probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POWPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in them agenes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

This PCR primer was used together with AAQ39510 for the PCR mapping of somatic cell hybrids. This is a method of assigning an EST (expressed sequence tag) to a particular chromosome. ESTs are markers for human genes actually transcribed in vivo. Unlike the random genomic DNA sequence tagged sites (STSs), ESTs point directly to expressed genes. The use of ESTs could facilitate the tagging of most expressed qenes. The use of ESTs could facilitate the tagging of most expressed qenes. The cuse of ESTs could facilitate the tagging of most expressed qenes. The vithin a few years at a fraction of the cost of complete genomic sequencing. Using these primers and disclosed methods sublocalisation can be achieved with panels of fragments from specific chromosomes or pools of large genomic clones in an analogous manner. This PCR primer sequence was designed from EST00356 by the computer program INTRON (National Institutes of Mental Health, Bethedda, MD) to minimise the chance of amplifying through an intron using the assumptions that: 1) introns are genomic sequences that interrupt the coding and non-coding sequences of genomic sequences that interrupt the coding and non-coding sequences of the human genes studied have 3' UTR of mRNA not interrupted by introns in the penomic DNA. This PCR primer localised EST00356 to chromosome 6.

Probe A (AAQ58798) is directed to the 5'-side of the v-myc oncogene and it was used together with a probe to the 3'-side of v-myc. An oligomuclectide was also added to the hybridisation mixt. which consisted of a sequence complementary to the sequence of the portion not complementary to the probes. Self-hybridisation of the target nucleic acid is inhibited giving an increased signal/noise ratio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences given in AAQ67117-20 are primers which were used in the method of the invention for the detecting mutation in a CD40 ligand gene. The method comprises isolating DNA from an individual and selectively amplifing the isolated DNA derived from the CD40 ligand gene. The amplification product is then analysed to determine if there is a mutation present and determining if a protein expressed from the ligand gene will bind CD40. The detection of mutations in the CD40 ligand gene allows subsequent treatment of a syndrome resulting in elevated levels of serum IgM and diminished levels of ther Ig isotypes, due to mutation in the CD40 ligand gene. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Probe; primer; PCR; amplify; polymerase chain reaction; detection; mutation; CD40 ligand gene; IgM; ss.

The calpain large subunit 1 gene located on chromosome 15 codes for a calcium activated neutral protease (CANP3) belonging to the calpain family. Mutations in the gene induce limb-girdle muscular dystrophy (LGMD) 2 disease. The gene, and fragements of it, can be used in the prevention, treatment, diagnosis and detection of a predisposition to LGMD2 disease. Fifty primers (AAT35510-59) were used to specifically amplify the exons and splice junctions of the calpain large subunit 1 gene as well as the regions containing the putative CAT, TATA boxes and the polyadenylation signal. Two primers (AAT35536, AAT32537) were used to amplify exon 13 of the gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human novel Calpain large sub:unit 1 gene encoding a calcium dependent protease - used to develop prods. for the diagnosis and treatment of limb-girdle muscular dystrophy 2 disease.

A genetically isolated group of families with autosomal dominant early-
conset Alzheimer's Disease (AD) has been studied and initial mapping
analyses have predicted the Ab4 locus (also known as STM2) resides on
chromosome 1. The group of families has been designated the Volga German
(VG) kindreds. The entire gene has been amplified from VG individuals and
canalysis has shown that affected individuals have a nucleotide change at
codon 141 resulting in an amino acid alteration from Asn to Ile. Portions
codon 141 resulting in a maino acid alteration from Asn to Ile. Portions
codon 141 be be used in a peptide vaccine. Detection of mutant
CAD4, for example using antibodies specific for the protein of mutant
CAD4, for example using antibodies specific for the protein or using
cucleic acid probes specific for the mutant gene, provides a means of
diagnosing Alzheimer's disease. In a specific example, ten pairs of
continuer were designed for PCR amplification of ten fragments acarrying the

Mouse CD34 reverse PCR primer.

```
A reverse primer (AAT75184) and a forward primer (AAT85183) were used to amplify mouse CD34 sequences from haematopoietic and endothelial cells. They were used in studies of Hu-B1.219 (see AAT75172) expression by long-term repopulating haematopoietic progenitor cells. The results showed that Hu-B1.219 is a marker of a subpopulation of early progenitor cells within the CD34+ fraction and can be used as a marker for their isolation. Hu-B1.219 expression was also detected in a CD34-subpopulation, and can be used as a marker to isolate CD34- stem cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR primer; chromosomal abnormality; abnormality detection; leukaemia; lymphoma; carcinoma; adenocarcinoma; sarcoma; glioma; neuroblastoma; medullablastoma; malignant melanoma; malignant neoplastic condition; ss.

AAZ40465-Z40466 for an internal intergene spacer region and primers AAZ40467-Z40468 for an external intergene spacer region. The invention can be used for the amplification and analysis of internal transcribed and external non-transcribed spacer regions from eukaryotic ribosomal DNA genes (especially 188 and 288 rDNA genes) from a wide range of taxonomic investigation of structural-functional organization of dna of The invention relates to the use of PCR using the universal primers Sidorenko AP; eucaryotic ribosomal claster. AAZ37473-Z37738 represent human mdm2 phosphorothioate oligonucleotides. AAZ37471, AAZ37472, AAZ37739, AAZ37740 and AAZ37741 are used in the exemplification of the present invention. The present invention describes novel nucleotide antisense compounds, targetted to the 5' untranslated, translation termination codon, or 3' untranslated region of an uncleic acid encoding human mdm2, that modulates expression of human mdm2. The oligonucleotides mediate their effect by antisense inhibition of hyperproliferative gene expression. The antisense compound is used to treat an animal having a disease or condition associated with mdm2, particularly a hyperproliferative condition, more particularly cancer, psecially of the blood, brain, breast, lung or soft tissue, or psoriasis, fibrosis, atherosclerosis or restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.

                                                                                           This invention describes a novel recombinantly produced number of this invention describes a novel recombinating production describes a novel recombinating activity. The ptc-2 protein is a hedgehog receptor and is therefore capable of modulating continuity antiparkinsonian and antiarthritic activity. The ptc-2 protein is a hedgehog receptor and is therefore capable of modulating hedgehog signalling, and so affect a number of hedgehog-mediated to hedgehog signalling. The human patched-2 tpc-2) protein can be used to screen for modulators, antagonists and agonists, which are likely to play an important role in the modulation of cellular profileration and be used to screen for modulators, antagonists and agonists, which are likely to play an important role in the modulation of cellular profileration and be used for in vivo reformation of itssue; to improve grafting and morphology of transplanted tissue; for the treatment, prevention and/or reduction of the severity of neurological conditions deriving from stroke), together with and deficits (such as ischenda resulting from stroke), together with and deficits (such as ischenda resulting from stroke), together with and deficits (such as ischenda resulting from stroke), together with and deficits (such as ischenda resulting from stroke), together with and deficits (such as ischenda and antonic antimulogical disease; chronic neurodegenerative diseases of the nervous system including parkinson's disease; thuringdon's chorea, and chronic immunological diseases of the nervous system including the create stroked and each of the nervous system, including the create stroked and also be used to prevent differentiation of antonomic disorders of the peripheral nervous system, including death, as well as sometyments of protein on a bused to prevent differentiation of the nervous system, including the same and cartial cardiac arrial cardiac arrial and cartial and cartial described as now, ptc-2 therapeutics may also be used to treat enemy here. In the treatment of the sepanerati
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .;

AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY3564- AAY35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Genome sequence of Chlamydia pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Page 1750; Disclosure; 1912pp; English.

                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                       PCR primers AA201426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AA201425). These ORFs encode polypeptides (see AA36754-737949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, principlis, cervicitis, salpingitis, perihepatitis, bartholinitis; pueumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these

AA236990-237023 represent probes for the polynuclectides encoding a human peripheral benzodiazepine receptor associated protein-1, designated PRAX-1. The probes may also function as PCR primers. PRAX-1 interacts specifically with the peripheral benzodiazepine receptor. The PRAX-1 gene is specifically with the peripheral benzodiazepine receptor. The PRAX-1 gene is associated with markers of pathologies of the central nervous system or immune system. The PRAX-1 nucleic acid is useful in gene therapy (of PRAX -1 deficiency conditions, as a source of diagnostic primers and probes (see CC AA236990-237023) and of antisense therapeutics; for recombinant production of the PRAX-1 protein; and for detecting allelic variants, mutations, deletions, insertions, loss of heterozygosity and gene carrangements in the PRAX-1 gene. The PRAX-1 protein is used to raise rearrangements in the PRAX-1 gene. The PRAX-1 protein is used to raise the present of the production of the pray-1 gene. The PRAX-1 protein is used to raise the present of the pray-1 protein is used to raise the pray-1 may be producted the pray-1 may be present the pray-1 protein is used to raise the pray-1 may be producted the pray-1 may be present the pray-1 may be presented the pray-1 may be protected the pray-1 may 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      e.g. for diagnosis of abnormal expression or accumulation of PRAX-1
New PRAX-1 polypeptide that interact with peripheral benzodiazepine receptor, used to treat e.g. immune, central nervous or endocrine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        therapeutic agents). The antibodies are used as immunoassay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 20 BP; 2 A; 8 C; 4 G; 6 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                   Claim 14; Page 21; 44pp; French.

targets a region of the human tundur necrosis factor alpha (TNPalpha)

targets a region of the human tundur necrosis factor alpha (TNPalpha)

nucleotide sequence. TNPalpha is an important cytokine that plays a role
nucleotide sequence. TNPalpha is an important cytokine that plays a role
in host defence. It is produced mainly in macrophages and monocytes in
response to infection, invasion, injury or inflammation. Overexpression

of TNPalpha can result in diseases the invention relates to antisense
inflammatory and autoimmune diseases. The invention relates to antisense
coligonucleotides, such as that represented by the present sequence which
are capable of modulating the TNPalpha gene expression. The
coligonucleotides optionally have a phosphorothicate backbone, and may
also optionally contain at least one 2. O-methoxyethyl modification. The
coligonucleotides are useful for modulating the expression of human
TNPalpha in cells and tissues, reducing a human cell inflammatory
cresponse, reducing the blood glucose level in a human and treating a
human having a disease or condition associated with TNPalpha. Examples of
diseases associated with TNPalpha include diabetes, inflammatory bowel
diseases of seconditions are also useful for modulating the
the antisense oligonucleotides are also useful for modulating the
function of a selected nucleic acid sequence in adipose tissue
                                                                                                                                                                                                                                                                                                                                                                                                         Antisense oligonuclectide, phosphorothioate, TNFalpha, cytokine, inhibit, tumour necrosis factor alpha, inflammatory bowel disease, diabetes; theumatoid arthritis, infectious disease, multiple sclerosis; hepatitis; panoreatitis, atopic dermatitis; allograft rejection; autoimmune disease; inflammatory disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents an antisense oligonucleotide sequence which

The present invention describes antisense oligonucleotides which modulate the expression of novel anti-apoptotic bcl-2-related proteins. The antisense oligonucleotides can be used as therapeutic agents to prevent or delay inflammation or tumour formation by promoting apoptosis in human cells or tissues. They can also be used as research agents to establish the function of particular genes and as diagnostic agents in sandwich assays for detecting the level of novel anti-apoptotic bcl-2-related proteins in a sample. The antisense oligonucleotides given in the present invention were designed to target human Al and mcl-1 anti-apoptotic bcl-2-related protein nucleotide sequences. The present sequence represents an antisense oligonucleotide sequence an antisense oligonucleotide for the human Al nucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0

Ribonucleotide reductase R1 gene antisense oligo AS-I-1599-20.

20-DEC-2000 (first entry)

```
The present sequence is an antisense oligonucleotide directed against the gene encoding the R1 component of mammalian ribonucleotide reductase. Ribonucleotide reductase catalyses the conversion of ribonucleotides to their corresponding deoxyribonucleotides and thus plays an important role in DNA synthesis and cell proliferation. Regulation of ribonucleotide reductase is altered in cultured malignant cells and increased levels of R2 protein and R2 mRNA have been found in pre-malignant and malignant tissues as compared to normal control tissues samples. The present antisense sequence is therefore useful for inhibiting tumourigenicity of neoplastic cells and inhibiting metastasis of tumour cells. It is also useful for increasing senticity of neoplastic cells to chemotherapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      drugs, thus allowing chemotherapeutic treatments to be used in patients who have become resistant or less sensitive to chemotherapy. The sequence may be RNA or DNA and may comprise a modified backbone and/or nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human MEKK5; mitogen-activated protein kinase kinase 5;

Sequences AAA61956-A61995 represent phosphorothioate antisense oligonucleotides targetted to the human MEKKS gene, which inhibit its capression. The antisense oligonucleotides were designed to target confiderate regions of the human MEKKS RNA, and were analysed for their different regions of the human MEKKS RNA, and were analysed for their effect on MEKKS mRNA levels by quantitative real-time PCR. MEKKS (also CK fnown as mitogen-activated protein kinase kinase 5, MEK kinase 6, MAP/ERK kinase kinase 5, apoptosis signal-regulating kinase 1, and ASKI) is a dual-specific serine/thronine kinase which mediates cellular CK responses to mitogenic stimuli by activating both the JNK/SAPK (Jun N-terminal kinase/stress-activated protein kinase) and p38 modules of MAP CK inase cascades. MEKKS is thought to play a critical role in the caputation of apoptosis (programmed cell death) by interacting with other proteins in this cascade and by phosphorylating downstream targets such as MKK3 and SEKI. MEKKS also participates in another apoptosis-related consulation and dimerisation of MEKKS is induced by tunour necrosis factor alpha (TNP-alpha), these processes being mediated by reactive oxygen species. Thioredoxin is able to associate with MEKKS and inhibit MEKKS of thisse activity and hence MEKKS dependent apoptosis. The oligonucleotides continuous metal of the modulation of transcripted of the modulation of transcripted of the metal of t
                                                                                                                                                                                                                                                                                                                                                                                                     Antisense compounds useful for treating or preventing infection, inflammation or tumor formation by inhibiting expression of human MEKKS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            of the invention are useful for diagnosis, prevention and treatment of conditions associated with MEKKS expression, such as inflammation and

                                                                                                                                                                                                                            The present invention describes a method for predicting susceptibility to HIV infection or HIV progression in a subject. The method involves detecting a polymorphism in a human interleukin-10 (IL-10) promoter, where the presence of the polymorphism in dethod provides prognostic information infection or HIV progression. The method provides prognostic information to persons infected with HIV virus and is useful to help select to presence of polymorphism is useful as predictor that very aggressive treatments (such as administration of IL-10 or gene therapy with IL-10). The presence of polymorphism is useful as predictor that very aggressive treatment could substantially eradicate the virus from the infected person. The method is useful for the generation of normograms or other predictive algorithms that can be used, in association with allele status, to prognose probable survival or years to development of AIDS of following HIV seroconversion. It indicates that increased expression of the IL-10 gene helps to reduce HIV-1 infection and pathogenic progression and enables a variety of new therapeutic interventions in the treatment of HIV disease. The present sequence represents a short tandem repeat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Human daxx inhibitory antisense phosphorothioate oligonucleotide SEQ:135.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an antisense compound 8 to 30 nucleobases in length targetted to a nucleic acid encoding glycogen synthase kinase 3 alpha. The antisense compound specifically hybridises with and inhibits the expression of glycogen synthase kinase 3 alpha. The antisense compound is useful for the treatment of a diseases associated with glycogen synthase kinase 3 alpha such as diabetes, a neurological disorder, a hyperproliferative disorder or a developmental disorder. The antisense compounds may also be used prophylactically to prevent or delay infection, inflammation or tumour formation. The present sequence is a phosphorothicate antisense.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense oligonucleotide; daxx; inhibition; phosphorothioate; Fas binding protein; CENP-C binding protein; dap6; EAP; cytostatic; antiinflammatory; death associated protein 6; Ets-1 associated protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          oligonucleotide targetted to human glycogen synthase kinase 3 alpha DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense compound 8 to 30 nucleobases in length comprising a compound that is targeted to a nucleic acid molecule encoding glycogen synthase kinase 3 alpha, useful for the treatment of e.g. diabetes and hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention relates to antisense oligonucleotides targeted to human PARP uncleic acid and inhibiting expression of human PARP. PARP (Poly (ADP-ribose) polymerase plays an important role in chromatin decondensation, DNA replication, DNA repair, gene expression, malignant transformation, cellular differentiation and apoptosis. The antisense oligonucleotide inhibitors are useful for inhibiting the expression of PARP in human cells of tissues. They are also useful for treating a human with a disease associated with PARP especially hyperproliferative fluorances (e.g. cancer), cellular injury resulting from oxidative stress, neurological (e.g parkinsonism, meningitis-associated intracranial arthritis) and disbetes. They present sequence is an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense compound useful for treating hyperproliferative, neurological, inflammatory and autoimmune disorders and diabetes inhibits human PARP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  a
                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes an antisense compound (1) up to 30 nucleobases in length, where (1) inhibits expression of daxx (also known as Fas binding protein, dape for dath associated protein 6 and EAP for Ets.1 associated protein). (1) has cytostatic and antiinflammatory activity, and can be used in antisense therapy and as a modulator of daxx. (1) is useful for inhibiting the expression of daxx in the or in vitro. (1) can be utilised for diagnostics, therapeutics for the treatment of diseases associated with the expression of daxx, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation and as research reagent. The present sequence represents an inhibitory human daxx antisense phosphorothioate oligonucleotide which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                              Novel antisense compounds capable of modulating expression of daxx useful for diagnosis, prophylaxis and treatment of diseases associated with expression of daxx.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; ss; PARP; Poly (ADP-ribose) polymerase; antisense oligonucleotide; cytostatic; nootropic; neuroprotective; antiinflammatory; antidiabetic; immunosuppressant; hyperproliferative disorder; cancer; cellular injury; oxidative stress; neurological disorder; parkinsonism; apoptosis; neurological disorder; parkinsonism; apoptosis; neningitis-associated intracranial complication; ischaemia; probe; inflammatory disorder; autoimmune disorder; arthritis; diabetes.

                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                                                                                                                                            .
                                                                                                                                                                                                              The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, involving administering a compound that modulates LXR- or RXR-mediated transcriptional activity or ABC1 expression or activity. The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition selected a lower than normal HDL cholesterol level, a higher than normal triglyceride level, and a cardiovascular disease
                                                                                                                                         Treating a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, by administering a compound that modulates LXR- or RXR-mediated transcriptional activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cancer associated protein; FOR gene; FRA16D; fragile site; aphidicolin; chromosomal rearrangement; cancer; splice variant; DNA instability; FRA16D oxidoreductase; neoplasia; PCR primer; ss.

pCR primers AAH27888-AAH28055 represent PCR primers used to amplify and identify minimal deletions in the human PRA16D oxidoreductase (FOR) gene.

The FOR gene encodes a cancer associated protein. The FRA16D site is a cancer associated protein. The FRA16D site is a cancer associated protein. The FRA16D site is a cancer cancer site is the location of breakpoints of a variety of canconsomal rearrangements, and other mutations associated with cancers. The FOR protein is expressed as a number of splice variants. FOR gene polymucleotide fragments are capable of acting as specific primers or probes for detecting cancer associated variations of DNA sequence such as a point mutation or small DNA rearrangement associated with the tumour, a point mutation or small DNA rearrangement associated with the tumour and a pause site within the FRA16 gene. FOR nucleic acid molecules are useful as markers to identify relationship between the fragile site (FRA16D) and the DNA instability in neoplasia which allows better
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to an antisense compound 8-30 nucleobases in length targeted to nucleobases 1-308 of the 5' untranslated region, 1776-1806 of the translated region termination codon region or 1818-2370 of the 3' untranslated region of a nucleic acid molecule encoding human mdm-2. The invention is useful for reducing hyperproliferation of human cells,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

Producing non-radioisotopically labeled PNA-DNA chimeras for nucleic acid analysis, comprises extending the chimera using a polymerase and an extension reagent with non-radioisotopically labeled nucleotide 5'-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for producing a non-radioisotopically labelled chimeras. The method comprises enzymatically extending a PNA-DNA chimera in the presence of a template nucleic acid, a polymerase and a primer extension reagent comprising a non-radioisotopically labeled nucleotide 5'-triphosphate capable of effecting enzymatic chimera primer extension. The present sequence is a primer used in the method of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antinflammatory; cytostatic; antibacterial; methionine aminopeptidase 2; inhibitor; metAP2; eukaryotic initiation factor associated protein; p67; eIF-2; protein synthesis; antisense oligonucleotide; infection; human; inflammation; tumour; phosphorothioate; 2-methoxyethyl wing; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
                                                                                                                               New antisense compounds which specifically hybridize with and inhibit human methionine aminopeptidase 2 expression, useful for treating methionine aminopeptidase 2 related disorders and preventing inflammation or tumor formation.
                                                                                                                                                                                                             Methionine aminopeptidase 2 (also known as MetAP2 and eukaryotic initiation factor [eIF-2] associated protein, ps7) is a cellular glycoprotein that promotes protein synthesis in the presence of active eIF-2 kinases by protecting the eIF-2 alpha subunit from phosphorylation. The present invention relates to antisense oligonucleotides (AAC67690-C67767) which inhibit human methionine aminopeptidase 2 coding sequence expression (see AAC67683). The present sequence is one such antisense oligonucleotide. The present sequence may be used for treating a patient suspected of having or being prone to a disease or condition associated with expression of MetAP2. In addition, the present sequence can also be functions of various members of a biological pathway. The antisense oligonucleotide may further be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. Note: the present
                                                                                                                                                                                                                                                                                                                                                                      sequence may have a phosphorothioate backbone and 2-methoxyethyl (2'-MOE)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a method for detecting the presence of polymorphisms associated with inflammatory bowel diseases such as ulcerative collitis and Crohn's disease. The methods can be used to dete the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                   Testing for the presence of polymorphisms associated with inflammatory bowel disease, using a hybridization assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, mdm2, hyperproliferative disorder, cancer; psoriasis; atherosclerosis; tumour; cytostatic; anti psoriatic; anti arteriosclerotic; vasotropic; antisense; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to antisense compounds, 8-30 nucleobases in length targeted to the 5' untranslated region, translation termination codon region, 'coding region or translation start site of a nucleic acid encoding human mdm2, where the antisense compound modulates the expression of human mdm2. The antisense oligonuclectides of the invention are useful for encoding human mdm2 and for inhibiting the expression of human mdm2. They may be used for treating an animal having a disease or condition associated with amplification of mdm2 gene or overexpression of mdm2 e.g. a hyperproliferative disorder such as cancer (blood, brain, breat, lung, or a soft tissue cancer) and psoriasis, fibrosis, atherosclerosis or restenosis, tumours, colorectal carcinoma and character with a chemotherapeutic agent to overcome drug resistance. The antisense compound reduces hyperproliferation of human cells. The administered with a chemotherapeutic agent to overcome drug resistance. The antisense compound, is also useful comethod, which involves the use of the antisense compound, is also useful comethod, which involves the use of the antisense compound, is also useful companies of diagnostic tools. PASS29421-AASS29507 represent the human mdm2 antisense
                                                                                    An antisense compound, useful for treating e.g. cancer, comprises nucleobases targeted a region (e.g. translation termination codon region) of a nucleic acid encoding human mdm2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 20;

                                                                                                                                                                                The present invention describes a method for predicting the potential of an oligonucleotide to hybridise to a (complementary) target nucleotide sequence, involving identifying a subset of oligonucleotides within the predetermined number of unique oligonucleotides based on the evaluation of the parameter. Oligonucleotides in the subset are identified that are clustered along a region of the nucleotide sequence that is hybridisable to the target nucleotide sequence. This is useful for evaluating
                   Predicting the potential of an oligonucleotide to hybridize to a target nucleotide sequence, useful for evaluating oligonucleotide probe sequences, by identifying a oligonucleotides based on the evaluation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                              to the target nucleotide sequence. This is useful for evaluating oligonucleotide probe sequences. The present sequence is an oligonucleotide described in the exemplification of the invention. Predicting the potential of an oligonuclectide to hybridize to a target nuclectide sequence, useful for evaluating oligonuclectide probe sequences, by identifying a oligonuclectides based on the evaluation of parameters.

Example 2; Col 67; 342pp; English.

The present invention describes a method for predicting the potential of an oligonucleotide to hybridise to a (complementary) target nucleotide sequence, involving identifying a subset of oligonucleotides within the predetermined number of unique oligonucleotides based on the evaluation of the parameter. Oligonucleotides in the subset are identified that are clustered along a region of the nucleotide sequence that is hybridisable

The invention relates to producing multicellular plants, organs or tissues transformed on their plastome, comprising altering/disrupting the function of a gene in a plastid genome for producing a selectable phenotype and selecting plants with plastids expressing the phenotype, transforming the plastid genomes of selected plants with a transformation vector with a restoring sequence for restoring function and separating transformed plants. This method is useful for producing multicellular plants, organs or tissues transformed on their plastome and for selection of antibiotics and herbicide resistance genes. Sequences ABS5237.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Transforming multicellular plants, by altering the function of a plastid gene, selecting plants expressing altered phenotype, transforming plants with a vector capable of restoring function and separating transformed

```
New antisense oligonucleotide encoding human cytohesin-1, useful for preventing or treating a disease or condition associated with cytohesin-1 expression e.g. tumor or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nucleobases targeted to a nucleic acid molecule encoding human cytohesin-ty specifically hybridises with, and inhibits the expression of, human cytohesin-1, a guanine nucleotide exchange protein for ARF (ADP ribosylation factor). The antisense compound may be used in a pharmacutical composition for inhibiting the expression of cytohesin-1 in human cells or tissues, and in treating a disease or condition associated with cytohesin-1 by administering to the human the antisense compound e.g. tumour or inflammation. The antisense compound is also useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. The present sequence is an antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          reagents and kits. The present sequence is an antisense oligonucleotide targeting human cytohesin-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a new antisense compound, comprising 8-30

```
The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the specified discrimination Nos are calculated discrimination of the multiwell discrimination of the multiwell discrimination of the mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the postitions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent PCR primers for human chromosome 1936-35 DNA, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                           Claim 4; Page 23; 528pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                         à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                              The invention relates to a novel antisense compound of 16-30 nucleotides targeted to any of 71 specified regions of the sequence that encodes human cytohesin-1 (CTI), where the compound hybridises and inhibits expression of human CTI. The compound of the invention has antiinflammatory, cytostatic, and anti-infective activity. The antisense compounds may have a use in antisense gene therapy. The antisense compounds are useful for treating or preventing disorders associated with expression of human CTI, e.g. infections, inflammation and tumours, and as research and diagnostic reagents. Sequences ABQ66412-ABQ66511 represent chimeric phosphorothiate oligonucleotides, with 2'-MOE wings and a deoxy gap. The claimed sequences inhibit production of cytohesin-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CD 151; porcine reproductive and respiratory syndrome virus; PRRSV; pig; selective breeding; xenotransplant; anti-RNA entry protein; anti-REP; anti-viral; vaccine; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              syndrome virus (PRRSV), useful for improving swine breeding, for CD 151 in a sample of cellular material of known origin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Determining susceptibility and resistance to porcine reproductive and respiratory syndrome virus (PRRSV), useful for improving swine breedin by assaying for CD 151 in a sample of cellular material of known origi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .

susceptibility or resistance of an animal to porcine reproductive and respiratory syndrome virus (PRRSV). This involves assaying for CD 151 in a sample of cellular material of known origin from the animal. In addition, coding sequences of CD 151 are described, and anti-viral compounds designated anti-RNP entry proteins (anti-RRPS). The method is useful for determining susceptibility and resistance to PRSV in an animal. This is particularly useful for improving swine breeding or for

The present invention relates to a method of determining the

0
screening different pig breeding lines. The method is also useful for developing non-simian recombinant cell lines for propagating the virus, for producing anti-viral compounds or vaccines for inducing immunity against PRRSV, and for diagnosting PRRSV infection in a swine. The present sequence is a PCR primer used to isolate the porcine CD 151 coding the printed specification, but was obtained in electronic form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pharmaceutical composition for treating ailments associated with impaired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5 or 3 end genomic flanking regions, 5 and 3' intron-exon junctions, or regions within 2-10 nuclectides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dystunction and a second active agent comprising an antinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or mallgnant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; antisense; lung dysfunction; nasal airway dysfunction; antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antisathmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.

antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences 888888888888

Pharmaceutical composition for treating ailments associated with impaired ö respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid ubiquinone

Disclosure; SEQ ID NO 4121; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or assal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an

of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO intiinflammatory steroid in a subject, for reducing or depleting levels at ftp.wipo.int/pub/published_pct_sequences

ubiquinone.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3 and anonic flanking regions, 5 and 3 intron-exon junctions or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an

antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences 8888888888888888

The invention relates to a compound 8-50 nucleobases in length targeted to a nucleic acid molecule encoding dual specific phosphatase 5, where the compound specifically hybridises with and inhibits the expression of dual specific phosphatase 5. The compound is used for treating an animal having a disease or condition associated with dual specific phosphatase 5 such as a hyperproliferative disorder, a developmental disorder, an inflammatory disorder or a disease which arises from aberrant apoptosis. Sequences ABX0962-ABX09139 represent human dual specific phosphatase 5 phosphorothioate oligonucleotides of the invention
                                                                                                                                                                                                                                              ö

Gene panel participating in liver regeneration, applicable in providing expression data, diagnosis and development of drugs for promoting liver regeneration e.g. after transplantation or removal of liver during
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises a gene panel constructed from the expression profile of known genes which show a change in expression level between normal liver cells and liver cells under regeneration. The gene panel i useful for providing expression data and screening/development of drugs for liver regeneration (e.g. when treating hepatitis, after transplantation or removal of the liver during cancer or hepatitis therapy). The present DNA sequence represents a PCR primer used in the

Length 20; Indels The invention relates to an isolated polypeptide comprising any of the 36 86-1370 residue amino acid sequences, given in the specification, a mature form of them, or a sequence that is at least 95 % identical to, or having one or more conservative amino acid substitutions in one of the 36 amino acid sequences. The polypeptides, nucleic acid molecules and antibodies of the invention are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The nucleic acid molecules, polypeptides and

Antidiabetic; anorectic; virucide; antibacterial; fungicide; nootropic;

```
antibodies are useful for treating, preventing or diagnosing diseases such as metabolic disorders, diabetes, obesity, infectious diseases cuch as metabolic disorders, diabetes, obesity, infectious diseases associated cachexia, neurodegenerative disorders, Alzheimer's disease, parkinson's disease, immune disorders, haematopoletic disorders, cancer and various dyslipidaemias, or metabolic disturbances associated with oberview may also be used as targets for the identification of and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopolesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind angiogenesis, in gene therapy, in generation of antibodies that bind diagnostic methods. The nucleic acids are further used as hybridisation disharmacogenomics. This polynucleotide represents a NOVX related reverse per primer of the invention
                                                                                                                                                                                                                                                                                                                       ö

                                                                                                            The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGP) receptor 3 (also known as FGFR-3, ACH, GTF4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or conditions hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research casents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /mod_base= OTHER

The invention relates to antisense compounds, compositions and methods for modulating the expression of PCTAIRE protein kinase 1 (also known as PCTAIRE-1, PFCK1 and CFK5). The antisense oligomucleotide is useful for treating an animal having a disease or condition associated with PCTAIRE protein kinase 1, particularly a hyperproliferative disease or a neural disease. These diseases include thrombocytopaenia, mental retardation, Wiskott-Aldrich syndrome, retinitis pigmentosa, dystonia with Parkinsonism, sideroblastic anaemia, X-linked Charcot-Marie-Tooth disease, or incontinentia pigmenti. The antisense oligomucleotide is particularly useful for inhibiting the expression of PCTAIRE protein kinase 1 in cells or tissues. It is useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence is an antisense oligomucleotide targetted to human PCTAIRE protein kinase 1 DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tumour necrosis factor alpha; TNF-alpha; antiinflammatory; antirheumatic; antiarthritic; antidiabetic; dermatological; hepatotropic; antiasthmatic; inflammatory bowel disease; Crohn's disease; colitis; rheumatorid arthritis; diabetes; pancreatitis; multiple sclerosis; atopic dermatitis; asthma; hepatitis;
                                                                                                                                                                                                                                                               New antisense oligonucleotides for modulating PCTAIRE protein kinase 1 gene expression, particularly useful for treating hyperproliferative or neurological disorders for example, mental retardation, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tumour necrosis factor alpha antisense oligonucleotide #490.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0.4%; Score 14.8; DB 1; Length 20; 18.9%; Pred. /note= "OTHER= Nucleotides 1-5 and 15-20 are 2'-O-methoxyethyl's (2-MOE)'s separated by a gap region of 2'-deoxynucleotides. Nucleotides 1-20 have a phosphorothioate backbone. All cytidine residues are 5-
                                                                                                                                                                                   The invention describes a method of treating an inflammatory disorder in an individual, comprising administering to the individual an obligonucleotide upto 30 nucleotides in length complementary to a nucleic acid molecule encoding human tumor necrosis factor (TNP)-alpha. The method is useful for treating an inflammatory disorder such as inflammatory bowel disease, Crohn's disease, colitis or rheumatoid arthritis, in an individual. The method is also useful for treating diabetes, pancreatitis, multiple sclerosis, atopic dermatitis, asthma, and hepatitis in an individual. This sequence represents an antisense oligonucleotide used to modulate expression of tumour necrosis factor
                                                                         Treating inflammatory disorders such as inflammatory bowel disease, Crohn's disease or rheumatoid arthritis, in a subject, by administering oligonucleotide which inhibits expression of human tumor necrosis factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antisense; modulating; expression; matrix metalloproteinase 1; MMP1; hyperproliferative disorder; cancer; inflammatory disorder; atherosclerosis; MMP1 inhibitor; cytostatic; antiinflammatory; antiarteriosclerotic; ss; human.
